## **1.0 Introduction**

The proponents created this Web-based Payroll System with Attendance Monitoring for Ochado Milktea Shop Alapan 1C Harvest Market Bucandala Branch aims to develop a system that could offer the required database for all payroll records and the anticipated storage requirements of the system. Second, it also entails the quick, precise, and simple computation of all current employee salaries for the anticipated client. This is done to improve the system's usability, security, and objectivity toward any outside factors. Lastly, a system that can generate reports of all payroll transactions needs to be developed.

The proponents aimed to help the Milktea Shop of Ochado Bucandala Branch in Alapan 1C Harvest Market to get the accurate working hours, to monitor the time in and time out of each employee and an automatic calculation of their respective wages or salaries.

## **1.1 Background of the Study**

Ochado is from the two Japanese words, OCHA and CHADO, which mean “Tea” and “Japanese way”, this tea concept prides itself in brewing the best quality tea with the most natural and freshest ingredients which sets it apart from other bubble tea concept and it started in Singapore in 2010 where the “Japanese way” of brewing tea has been popular and loved by many tea-lovers.

The Payroll System and Attendance Monitoring of the Ochado Alapan 1C Harvest Market Bucandala Branch is one of the shops that still process attendance records and salary computation manually and is at times inaccurate whenever it comes in computation of payroll and time in and time out. As well, the company's employees using mechanical time clock to record dates and times on their time cards, the officer in charge evaluated the wages of each employee on the time of work in and out each and every day. Spreadsheets are difficult to use and time-consuming to create the payroll slip and time recording that the Officer in Charge need to encode every employee's attendance. Therefore, the Ochado Milk Tea Shop Alapan 1C Harvest Market Bucandala Branch Payroll System and Attendance Monitoring needs improvement.

According to Vinod Kumar Shukla & Nisha Bhandari (2019) To manage payroll management of any organization is an arduous task. It is always a challenge for a manager to complete this with 100% perfection. These are the kind of work which needs utmost attention with complete accuracy. The Salary is the biggest motivation for any employee in the organization to work. Salary increments, allowances, promotion, bonus, all revolve around employee salary. Since employees end up filling too many forms and documents at the end of the year, so it's very time-consuming.

Also, the data that is collected is not as useful as it is not real time. Eventually, due to this entire arduous and time-consuming task were undertaken by the employees and HR, the productivity of the organization dwindles to a certain extent.

By this proposed system, a web-based online attendance monitoring and payroll processing system for employees. The proposed system will help get the accurate working hours, to monitor the time in and time out of each employee and an automatic calculation of their respective wages or salaries.

We chose Ochado Bucandala Branch 1C as our study subject because they still track employee attendance and pay by hand. Typically, a manual payroll and attendance system necessitates a lot of paperwork. Additionally, manual processes place a burden on administrative tasks on the HR team and the business. Payroll systems are used by business owners to pay employees for their labor as an accounting or financial function. Depending on the knowledge and experience of the business owner, payroll systems may be internal or external. Payroll software is essential in order to streamline tasks like registering, monitoring payments, and updating employee information related to payroll. One advantage of using payroll software is that it has a much lower total life-cycle cost and effectively manages time, work efficiency, and organization size.

## **1.2 Statement of the Objectives**

### **1.2.1 General Objectives**

To help the Ochado Bucandala Branch to have an efficient and effective way of monitoring their employee's time/attendance and payroll system to give a higher quality of service.

### **1.2.2 Specific Objectives**

- Develop a system that will improve the Ochado Bucandala Branch process in the Attendance Monitoring and Payroll;
- Develop a system that will monitor employee's data that is efficient to use;
- Secure the records of employees and to have more manageable files;
- Calculate an accurate salary or wages of employees.

### **1.3 Significance of the Study**

This study improved the current payroll and attendance monitoring processes of the Ochado Milk Tea Shop. The new system would automate and streamline these processes, potentially resulting in increased efficiency and accuracy, and ultimately, cost savings for the business. Additionally, the study may also highlight how the system can provide managers with real-time access to attendance and payroll data, allowing them to make more informed decisions and improve overall operations.

### **1.4 Scope and Limitation of the Study**

This system focuses on the Payroll and Time in & Time out of the Ochado Milk Tea Shop Alapan Branch 1C Harvest Market Employees and other personnel, which help them be more convenient and help the Branch make the significant improvement they need. The proponents developed payroll system and attendance monitoring to help the Ochado Bucandala branch to give them a higher quality service.

The employee's salary will not be sent through Automated Teller Machine (ATMs) or any online cash application, neither cheque, for the reason that the company

insisted that salaries must be on a cash basis. No other currencies are computed in the system but Philippine Peso only. The proposed system can only be accessed online and it focuses only on the employees' Payroll and Attendance Monitoring of Ochado Alapan 1C Harvest Market Bucandala Branch. This proposed system is only applicable and can only be used by the management of Ochado Alapan 1C Harvest Market Bucandala Branch.

## 2.0 Methodology of the Study

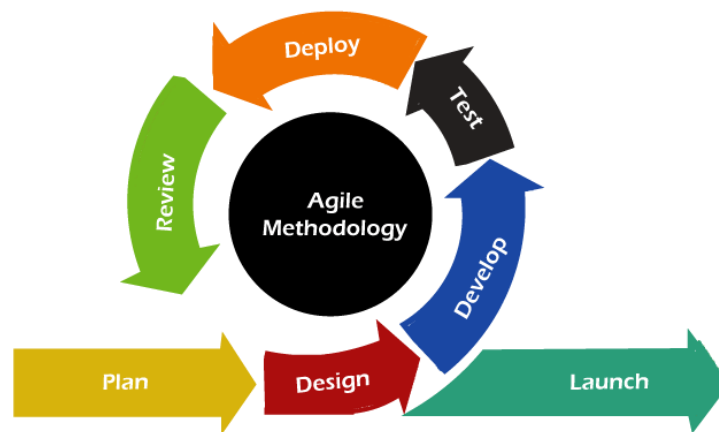

Figure 1. Agile Methodology

- Planning Phase

In creating the system, the proponents the first phase of System Development Life Cycle's Agile Model. The proponents gather information through interviews to the Ochado Bucandala Branch OIC and found out that the Ochado Bucandala Branch is one of the shops that still process attendance records and salary computation manually and is at times inaccurate whenever it comes in computation of payroll and time in and time out.

- Design Phase

In the second phase of System Development Life Cycle's Agile Model, the proponents used HTML & CSS, Bootstrap and PHP as the programming language and XAMPP as the database in building the system.

- Develop Phase

In the third phase of System Development Life Cycle's Agile Model, the proponents will build the web-based payroll with attendance monitoring system for Ochado Bucandala Branch.

- Test Phase

In the fourth phase of System Development Life Cycle's Agile Model, the proponents will test the built system before giving it to the client to ensure the quality of the system.

- Deploy Phase

In the fifth phase of System Development Life Cycle's Agile Model, the proponents will deploy the built system to the client.

- Review Phase

In the last phase of System Development Life Cycle's Agile Model, the proponents will review or inspect the outcome of the built system and collect feedback from all the end users.

### **3.0 Data Gathering Procedures and Output**

The proponents intend to build a Web-based Payroll System with Attendance Monitoring for Ochado Bucandala Branch. The proponents also aim to make the system user friendly, get the accurate working hours, to monitor the time in and time out of each employee and an automatic calculation of their respective wages or salaries. To achieve the goal of implementing the system, the proponents need to collect data that will be used to develop the system.

There are various methods that can be utilized in the data collection process. Interviewing is one of the most widely used techniques. The proponents have chosen this approach, even though it may be time-consuming, as it guarantees that the data collected from the respondents is accurate. This technique has enabled the proponents to obtain sufficient information and insights on how to develop the system.

To collect the necessary data to build the system, the proponents employed the following methodology: conducting interviews to gather information that will be beneficial in creating the system, such as details on how payroll is processed, the range of salaries, schedules of employees, salary calculations and other related information. Additionally, the proponents also employed internet research to find programming syntax.

## **4.0 The Existing System**

### **4.1 Company Background**

Ochado is a well-known international milk tea brand that has established a presence in the Philippines. It originated in Singapore in 2010, where it quickly gained popularity among tea enthusiasts for its unique approach of brewing tea using natural and fresh ingredients, setting it apart from other similar concepts. The name Ochado is derived from the Japanese words for "tea" and "Japanese way." The brand has since expanded to other countries and in the Philippines, one of the franchises is located at Imus Bucandala Alapan 1C Harvest Market. The company is dedicated to becoming a staple for tea lovers in the region and aims to provide a comfortable and inviting atmosphere for customers to relax and socialize with friends or read a book while enjoying their high-quality tea and snacks. Ochado continues to innovate and improve its products and services to meet the growing demand for high-quality and excellent service. However, Bucandala Ochado Branch is one of the shops that still process attendance records and salary computation manually and is at times inaccurate whenever it comes in computation of payroll and time in and time out.

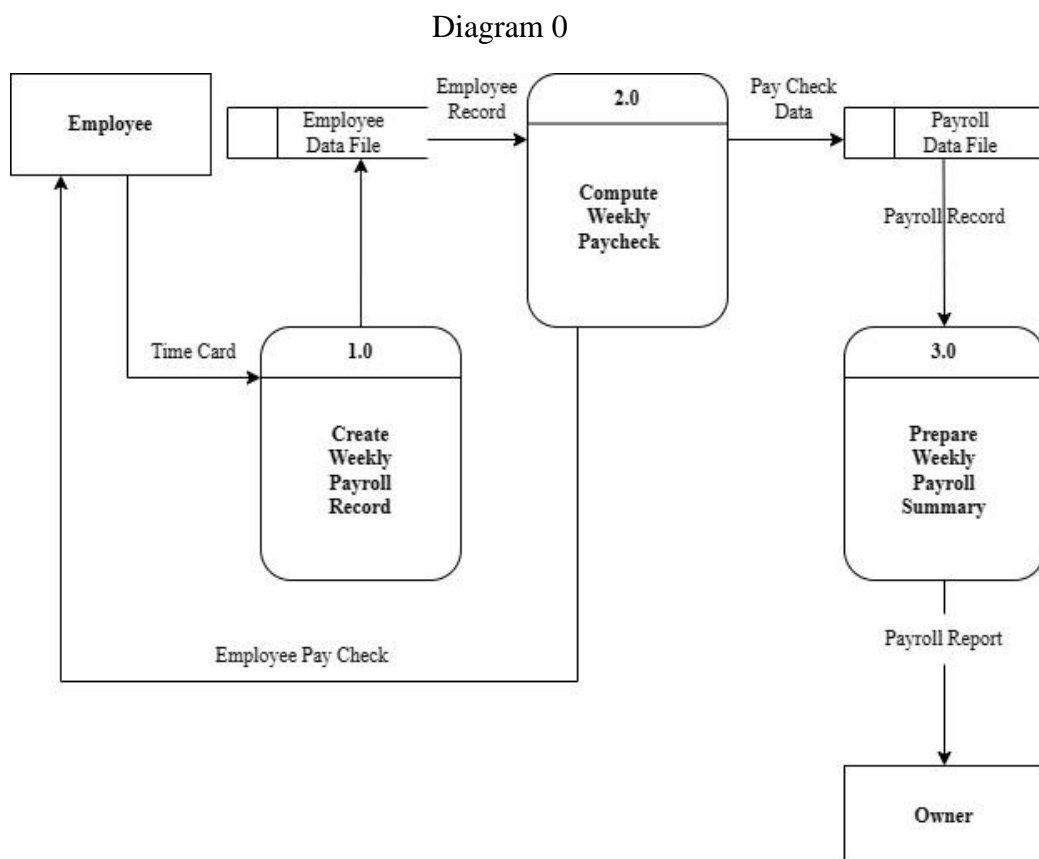

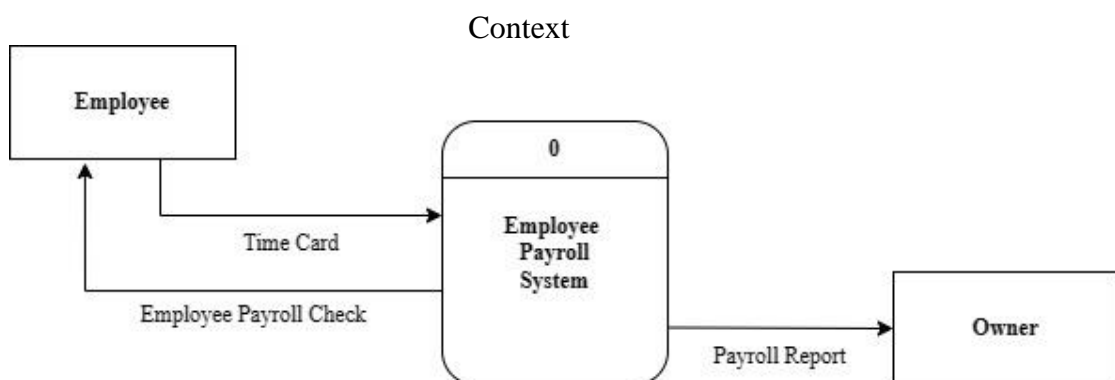

### **4.2 Description of the System**

The manual payroll calculation that is currently used by Ochado Milk Tea Shop Alapan 1C Harvest Market Bucandala Branch involves the process of calculating payroll by hand. The person-in-charge must manually compute all the wages and necessary deductions when using manual calculations. However, this method may put the OIC at risk of making errors if he or she is not diligent.

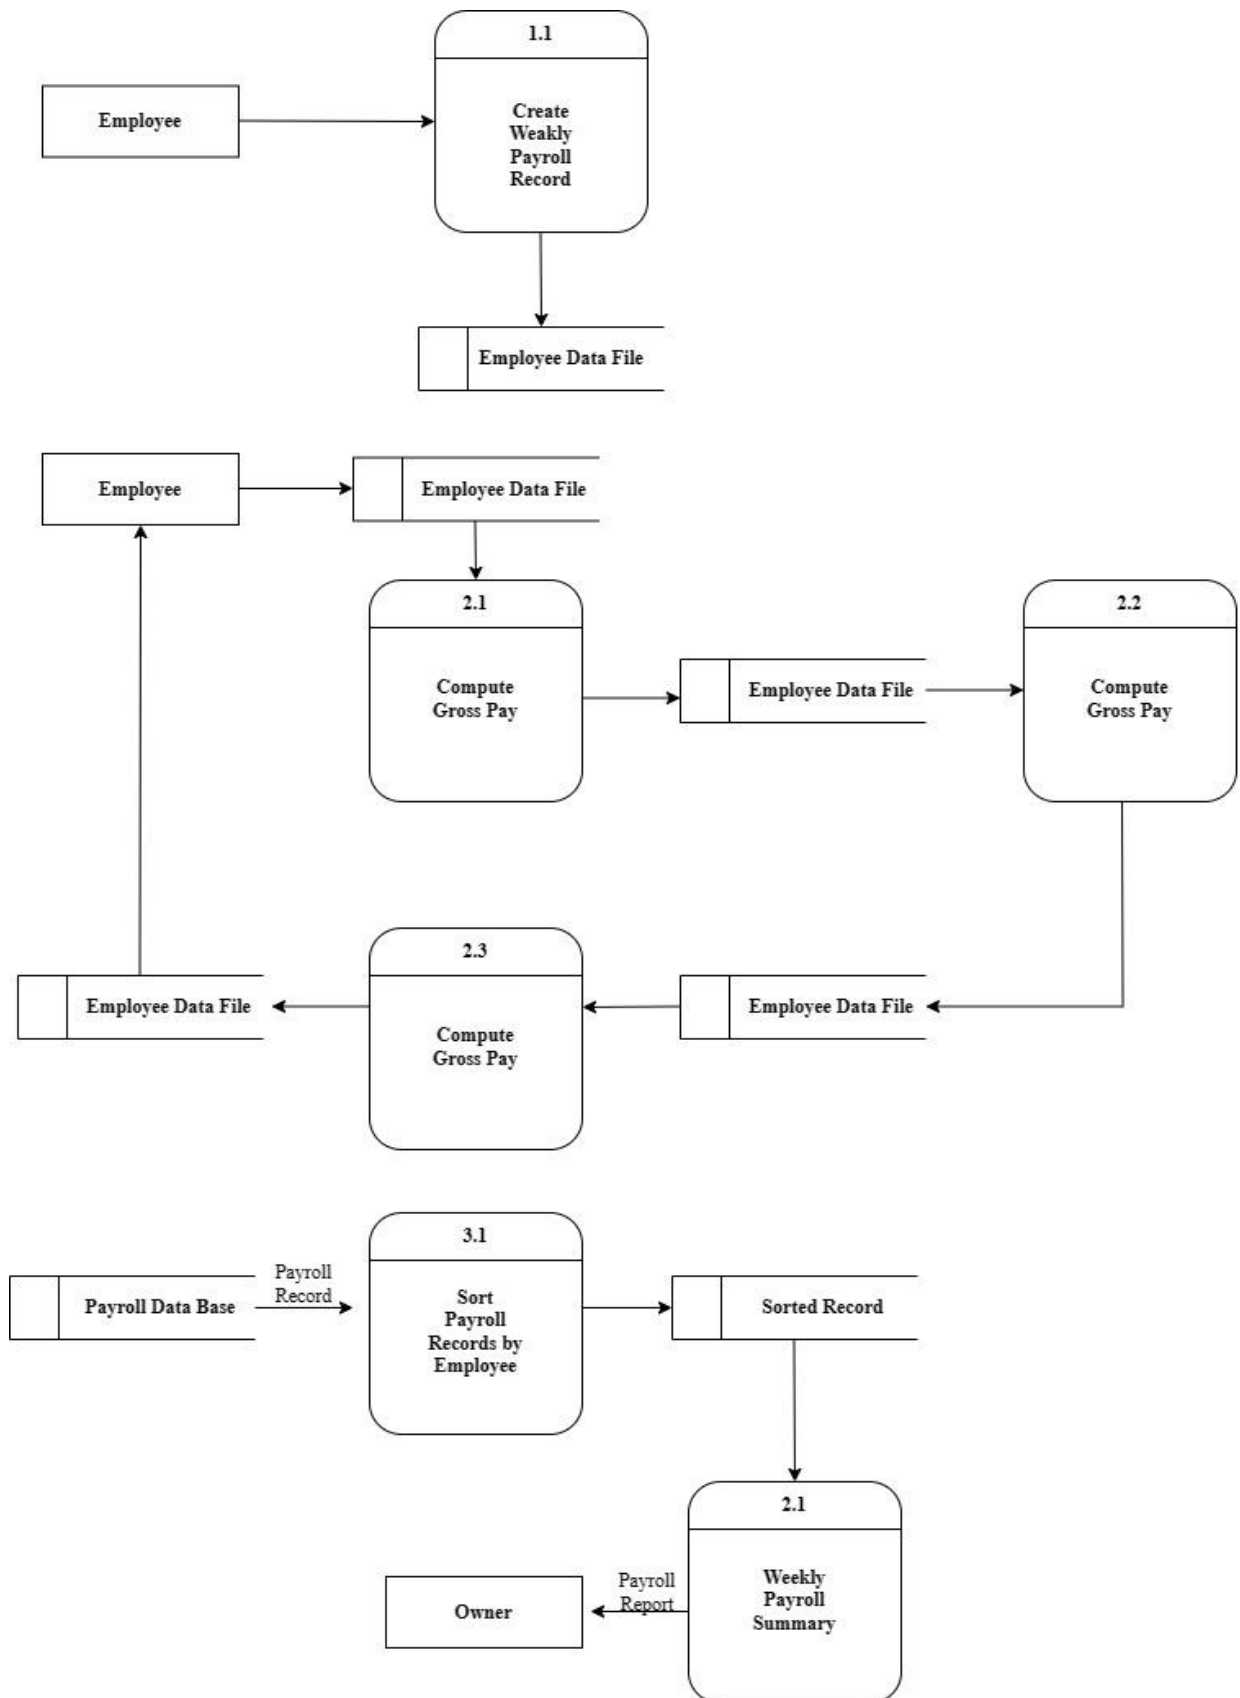

This payroll system can assist in simplifying time-consuming tasks like

processing direct deposits, generating payroll reports and calculating tax withholdings. It will be much faster to complete these tasks. Also, it eliminates the risk of human errors that might occur from manual data entry for payroll calculations. The payroll software calculates figures such as deductions and overtime pay with the highest level of precision.

### 4.3 Data Flow Diagram

#### 4.4 Data Dictionary

Table 1.0 Ochado\_Weekly Payroll Record

<b>FIELDS</b>	<b>DATA TYPE</b>	<b>LENGTH</b>	<b>DESCRIPTION</b>
Mon	Date	20	Monday
Tues	Date	20	Tuesday
Wed	Date	20	Wednesday
Thurs	Date	20	Thursday
Fri	Date	20	Friday
Sat	Date	20	Saturday
Sun	Date	20	Sunday

Table 2.0 Ochado\_Weekly Paycheck

<b>FIELDS</b>	<b>DATA TYPE</b>	<b>LENGTH</b>	<b>DESCRIPTION</b>
Name	varchar	225	Employee's Name
Days	numeric	50	Days of work
Rest Days	numeric	50	None working days
Salary	numeric	50	Total salary of employee
Days of week	varchar	255	Weekend or Weekdays

Table 3.0 Ochado\_Weekly Payroll Summary

<b>FIELDS</b>	<b>DATA TYPE</b>	<b>LENGTH</b>	<b>DESCRIPTION</b>
Name	varchar	225	Employee's Name
Days	numeric	50	Days of work
Rest Days	numeric	50	None working days
Salary	numeric	50	Total salary of employee

#### 4.5 Problem Areas

Manual computation of wages and attendance monitoring can present several challenges. One of the main issues is the risk of errors, as manual calculations are more susceptible to human errors such as miscalculations, incorrect data entry, and transposition errors. This can lead to inaccuracies in payroll and incorrect payments to employees. Additionally, manual computation is a time-consuming task that requires a significant amount of effort, particularly for businesses with a large number of employees. This can lead to delays in processing payroll, which can negatively impact employee satisfaction and morale.

Using time cards to monitor attendance can also present problems. There is a potential for errors in recording and tracking attendance when employees are responsible for recording their own attendance. This can lead to inaccuracies in tracking attendance and may result in incorrect payments for overtime or missed attendance. Furthermore, manual timekeeping may also be subject to manipulation or fraud from employees, making it difficult to monitor attendance correctly. This can lead to inefficiency and loss for the company.

In addition to these problem areas, manual computation and time card monitoring can also be prone to data loss if not properly managed. By identifying and addressing these potential problem areas, the process of manual computation of wages and attendance monitoring can be improved, resulting in more accurate and efficient payroll and attendance tracking for businesses.

## **5.0 Proposed System**

### **5.1 System Overview**

Web-based Payroll System with Attendance Monitoring for Ochado Bucandala Branch system helped them get the accurate working hours, to monitor the time in and time out of each employee and an automatic calculation of their respective wages or salaries. Additionally, it aims to develop a system that could offer the required database for all payroll records and the anticipated storage requirements of the system. Second, it also entails the quick, precise, and simple computation of all current employee salaries for the anticipated client. This is done to improve the system's usability, security, and objectivity toward any outside factors. Lastly, a system that can generate reports of all payroll transactions needs to be developed.

The system is built on Windows 10 operating system and running it on a different operating system or an older version may cause compatibility issues. The system was also constructed using the latest versions of Visual Studio Code and XAMPP MySQL. Similar to the operating system, the system may encounter compatibility issues when run on older versions of Visual Studio Code and XAMPP MySQL. Additionally, an internet connection is required to access and use the system.

## **6.0 System Coding**

### **6.1 Programming Language**

In developing the system, the proponents utilized HTML, CSS, JavaScript, PHP, and SQL as the programming languages. HTML, CSS and Bootstrap were used for the design and layout of the system, while JavaScript, PHP and SQL were used for creating the logic and functionality of the system.

### **6.2 Special Purpose Language Tools**

During the development of the system, the researchers used XAMPP as the database for the Web-based Payroll with Attendance Monitoring of Ochado Milk Tea Shop Bucandala Branch

## **7.0 System Testing Plan**

### **7.1 Testing Stages**

The proponents used a trial-and-error method during testing. They would test the system during client meetings to identify and correct any errors, in an effort to reduce the potential for future errors.

### **7.2 Testing Schedules**

Due to conflicting schedules between the system proponents and the client, there is no fixed schedule for conducting joint testing. Testing is performed when both parties are able to coordinate and meet. During these sessions, the client conducts tests and provides feedback on any errors identified. The proponents then make necessary revisions and repeat the process until the system is deemed functional and error-free.

## **8.0 System Implementation Plan**

### **8.1 Resource Requirements**

#### **8.1.1 Hardware Requirements**

- Laptop
- Keyboard
- Mouse
- Internet

#### **8.1.2 Software Requirements**

- Windows 10
- Visual Studio Code
- XAMPP

### **8.1.3 Human Resource Requirements**

- Computer Literate User
- Digital Literacy

## **8.2 Implementation Plan**

### **8.2.1 Site Implementation**

The user's experience on the site should be pleasant, with minimal distractions and a comfortable environment that allows for clear understanding and concentration while using the proposed system. The website should also have the necessary computer equipment for utilizing the system.

### **8.2.2 Personnel Training**

Once the system was implemented, the proponents will train personnel who is proficient in using computers. After the personnel were trained, this person will be responsible for operating and maintaining the system. The system has been designed to be user-friendly, so that it is easy for the person managing it to use.

### **8.2.3 System Conversion**

The proponents enhanced the existing manual system with a computerized one. This new system improves the accuracy of payroll and attendance tracking by precisely recording the working hours of each employee and automatically computing their wages or salaries.

### **8.2.4 Data Conversion**

The proponents enhanced the manual data used in the existing system into computer data. These data will be stored in a database in which it will be

secured from unauthorized person who is using the system.

#### **8.2.5 Implementation Schedule**

Once the system was built, installed, and tested, the proponents will implement the system at the Ochado Alapan 1C Harvest Market Bucandala Branch. This implementation will allow the proponents and the client to evaluate the system's performance and identify any potential issues or errors.

### **9.0 System Maintenance Plan**

Once the new system was implemented and tested, there may be issues that arise in the future. To address this, the proponents will provide the client with a contact number for assistance in case they have difficulty using the system.
